(54) Title: **RADIOPAQUE INTRALUMINAL STENT**

(57) Abstract: The present invention includes a radiopaque stent comprising a cylindrical main body. The tubular main body comprises a cobalt chromium alloy that comprises cobalt, chromium and one or more radiopaque materials.

WO 01/72349 A1

5

Background of the Invention

The present invention relates to a radiopaque intraluminal stent comprised of a cobalt chromium alloy with one or more radiopaque elements and to a method for making the radiopaque intraluminal stent.

10 Intraluminal stents implanted with percutaneous methods have become a standard adjunct to procedures such as balloon angioplasty in the treatment of atherosclerotic disease of the arterial system. Stents, by preventing acute vessel recoil, improve long term patient outcome and have other benefits such as securing vessel dissections.

Intraluminal stents comprise generally tubular-shaped devices
15 which are constructed to hold open a segment of a blood vessel or other anatomical lumen. Intraluminal stents are used in treatment of diseases such as atherosclerotic stenosis as well as diseases of the stomach and esophagus, and for urinary tract applications. Adequate stent function requires a precise placement of the stent over a lesion or site of plaque or other lumen site in need of
20 treatment. Typically, the stent is delivered to a treatment site by a delivery catheter that comprises an expandable portion for expanding the stent within the lumen.

One delivery catheter onto which the stent is mounted is a balloon delivery catheter similar to those used for balloon angioplasty procedures. In
25 order for the stent to remain in place on the balloon during delivery to the site of damage within a lumen, the stent is compressed onto the balloon. The catheter and stent assembly is introduced within a patient's vasculature using a guiding catheter. The guidewire is disposed across the damaged arterial section and then the catheter-stent assembly is advanced over the guidewire within the artery until
30 the stent is directly within the lesion or the damaged section.

The balloon of the catheter is expanded, expanding the stent against the artery. The artery is preferably slightly expanded by the expansion of

the stent to seat or otherwise fix the stent to prevent movement. In some circumstances during treatment of stenotic portions of the artery, the artery may have to be expanded considerably in order to facilitate passage of blood or other fluid therethrough. In the case of a self expanding stent, the stent is expanded by retraction of a sheath or actuation of release mechanism. Self expanding stents appose themselves to the vessel wall automatically and require a dilatation balloon only for post dilatation.

These manipulations are performed within the body of a patient by an interventionalist who relies upon both placement markers on the stent catheter and on the radiopacity of the stent itself. The stent radiopacity arises from a combination of stent material and stent pattern. After deployment within the vessel, the stent radiopacity should allow adequate visibility of both the stent and the underlying vessel and/or lesion morphology under fluoroscopic visualization.

Other conventional stents incorporate materials, such as tantalum, that aid in identifying the location of the stent within a vessel but illuminate so brightly under fluoroscopy that the underlying vessel morphology is obscured, thereby impairing the ability of the interventionalist to repair the lesion. Other stents incorporate radiopaque markers that facilitate stent location, but do not allow adequate stent visualization to assist determination of optimal deployment.

Summary of the Invention

One embodiment of the present invention includes a radiopaque stent. The radiopaque stent comprises a cylindrical main body. The cylindrical main body comprises a cobalt chromium alloy that comprises cobalt, chromium and one or more radiopaque materials.

Another embodiment of the present invention includes an assembly comprising a catheter and a radiopaque stent. The radiopaque stent comprises a cobalt chromium alloy that comprises cobalt, chromium and one or more radiopaque materials.

One other embodiment of the present invention includes a method for making a radiopaque stent. The method comprises providing a tube. The

stent.

Another embodiment of the present invention includes a method
5 for positioning a stent in a lumen of a living being. The method comprises
providing a radiopaque stent. The radiopaque stent comprises a cylindrical main
body that comprises a cobalt chromium alloy. The cobalt chromium alloy
comprises cobalt, chromium, and one or more radiopaque materials, deformable
in a ductile manner, rendering the radiopaque stent balloon expandable on the
10 delivery system. The stent is unexpanded. The stent is transported to a lesion
site in the lumen wherein the stent is optionally imaged during transport. The
stent is expanded to contact the lesion. The radiopaque stent is imaged during or
after expanding the stent.

Another embodiment of the present invention includes a
15 radiopaque stent comprising one or more wires. The wires comprise a cobalt
chromium alloy. The cobalt chromium alloy comprises cobalt, chromium and
one or more radiopaque materials.

Description of the Drawings

FIG. 1 is an elevational view, partially in section, of one
20 embodiment of a radiopaque stent of the present invention, mounted on a
delivery catheter and disposed within a damaged lumen;

FIG. 2 is an elevational view, partially in section, showing one
embodiment of the radiopaque stent of the present invention expanded within a
damaged lumen;

25 FIG. 3 is an elevational view, partially in section showing the
expanded radiopaque stent within the lumen after withdrawal of the delivery
catheter;

FIG. 4 is a perspective view of one embodiment of the radiopaque
stent of the present invention in an unexpanded state, with one end of the stent
30 being shown in an exploded view to illustrate the details thereof;

FIG. 5 is a plan view of a flattened section of one radiopaque stent embodiment which illustrates an undulating pattern of the stent shown in FIG. 4;

FIG. 5a is a sectional view taken along the line 5a--5a in FIG. 5;
5 and

FIG. 6 is a schematic representation of equipment for selectively cutting the tubing in the manufacture of the radiopaque stent of the present invention.

FIG. 7 is a perspective view of one tubular embodiment of the
10 radiopaque stent of the present invention.

FIG. 8a is a perspective view of one embodiment of the radiopaque stent of the present invention that includes a backbone.

FIG. 8b is a perspective view of one other embodiment of the radiopaque stent of the present invention that includes a staggered backbone.

FIG. 9 is a side view of a coiled embodiment of the radiopaque
15 stent of the present invention.

FIG. 10 is a perspective view of a ratcheted embodiment of the radiopaque stent of the present invention.

Detailed Description

20 The radiopaque stent of the present invention comprises a main body, one embodiment of which is illustrated generally at 10 in FIG. 1, that is fabricated from a cobalt chromium alloy that comprises one or more radiopaque elements. The radiopaque elements are selected from a group of elements with atomic numbers from 40 to 53 that include Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd,
25 In, Sn, Sb, Te and I, and those with atomic numbers from 56 to 79 that include Ba, La, Hf, Ta, W, Re, Os, Ir, Pt and Au. These are elements that lie primarily within the transition metal block in the second and third row of the Periodic Table. The cobalt chromium alloy fabricated using these radiopaque elements deforms in a ductile manner, rendering the radiopaque stent of the present
30 invention balloon expandable. A radiopaque cobalt chromium alloy may be applicable to a self-expanding stent.

comprising one or more elements.

For some embodiments, the radiopaque stent of the present invention is fabricated from a single tube subjected to chemical etching, laser
5 machining, conventional machining, electronic discharge machining (EDM), ion milling, slurry jet, or electron beam treatment or combinations of these treatments. For other embodiments, the stent is fabricated from wire elements that are welded together. For additional embodiments, the stent is fabricated from flat stock and is patterned, then rolled and welded. For other embodiments,
10 the stent is fabricated from near-net shape processing such as metal injection molding.

One embodiment of the cobalt chromium alloy-based radiopaque stent of the present invention is comprised of chromium in a concentration of 10-25% by weight, radiopaque elements in a concentration of 10-30% by weight,
15 nickel in a concentration of 5-15% by weight, molybdenum in a concentration of 0-5% by weight, iron in a concentration of 0-5% by weight, manganese in a concentration of 0-5% by weight and other trace materials in a concentration of 1% maximum. The balance of material is cobalt.

The radiopaque stent of the present invention overcomes
20 limitations and weaknesses of other imagable stents by imparting a more visible image when absorbing x-rays during fluoroscopy. With this more visible image, the entire stent is better observed by the interventionalist placing the stent. The image observed by the interventionalist is not "washed out" due to excessive brightness and is not too dim. Because of the improved image, the stent is
25 accurately positioned and manipulated within a lumen of a patient, with a radiopacity such that stent expansion during and after deployment may be assessed accurately by the interventionalist. An additional advantage to the better radiopacity is the visualization of the stent and the underlying vessel during follow-up examinations by the interventionalist.

30 Because the entire stent is radiopaque, the diameter and length of the stent are readily discerned by the interventionalist. Also, because the stent

itself is made of the radiopaque alloy, the stent does not have problems associated with radiopaque coatings, such as cracking or separation or corrosion. Also, because the entire stent is radiopaque, the stent does not require extra markers with their attendant issues.

5 The low profile of the cobalt chromium stent of the present invention, coupled with its enhanced radiopacity renders the stent more deliverable with easier observation and detection throughout its therapeutic use than stents heretofore available. A stent constructed of a radiopaque cobalt chromium alloy can be made thinner than one of stainless steel without
10 sacrificing fluoroscopic visibility. The low profile of the cobalt chromium stent of the present invention renders the stent more deliverable with greater flexibility.

 Furthermore, improved radiopacity of the low profile stent of the present invention increases deliverability of the stent and offers solid
15 performance advantages regarding decreasing the fluid mechanical disturbances of blood flow. Improved radiopacity assists the physician in placing the device precisely. Inflation of the stent is better monitored because the stent is visible to the interventionalist. This visibility reduces the incidence and probability of an underdeployed stent. Further, in-stent restenosis is monitored as the stent and an
20 injected contrast agent are able to be imaged simultaneously. Unlike some stents, the stent of the present invention does not produce an image which is too bright, thereby obscuring imaging of the underlying vessel morphology.

 Many cobalt chromium alloys, although very strong, have an insufficient percent elongation for use in a stent. It has been found that the
25 alloys described herein have at least 20% or greater elongation and thereby should achieve adequate stent expansion. Some of the cobalt chromium alloys of the present invention also include materials such as tungsten or tantalum. These materials not only impart an optimum radiopacity to the cobalt chromium alloy but also impart corrosion resistance and a resistance to oxidation at high
30 temperatures.

It is believed that a cobalt chromium alloy that contains 15% by weight tungsten is radiopaque to a degree suitable and within the scope of the present invention. The cobalt chromium alloy L-605 has a minimum ultimate tensile strength of 125 ksi, a minimum yield strength of 45 ksi and a minimum
5 total elongation of 30%.

Although the cobalt chromium alloys such as L-605 have not been previously used in the manufacture of stents, the alloy has had use in orthopedic cerclage wires and blood contacting applications in heart valves. In these applications, no problems related to biocompatibility have been found.

10 The cobalt chromium alloy-based radiopaque stent of the present invention is suitable for use in conjunction with MRI imaging. Many cobalt chromium alloys such as MP35N and L-605 are nonmagnetic.

The radiopaque stent of the present invention is fabricated to have a variety of design embodiments. These design embodiments include a solid
15 cylinder, illustrated at 70 in FIG. 7, a coiled stent illustrated at 90 in FIG. 9, a ratcheting stent 100, illustrated in FIG. 10 and stent embodiment 80 with a backbone 81, illustrated in FIG. 8a and stent embodiment 82 with a staggered backbone, illustrated in FIG. 8b.

One type of radiopaque stent design embodiment is a high
20 precision patterned cylindrical device. This device is illustrated generally at 10 in Figure 1. The stent 10 typically comprises a plurality of radially expanded cylindrical elements 12 disposed generally coaxially and interconnected by elements 13 disposed between adjacent cylindrical elements.

For some embodiments, the stent 10 is expanded by a delivery
25 catheter 11. The delivery catheter 11 has an expandable portion or a balloon 14 for expanding of the stent 10 within an artery 15. The delivery catheter 11 onto which the stent 10 is mounted is similar to a conventional balloon dilation catheter used for angioplasty procedures. The artery 15, as shown in Figure 1, has a dissected lining 16 which has occluded a portion of the arterial
30 passageway.

Each radially expandable cylindrical element 12 of the radiopaque stent 10 is independently expandable. Therefore, the balloon 14 may be provided with an inflated shape other than cylindrical, e.g., tapered, to facilitate implantation of the stent 10 in a variety of body lumen shapes.

5 The delivery of the radiopaque stent 10 is accomplished by mounting the stent 10 onto the inflatable balloon 14 on the distal extremity of the delivery catheter 11. The catheter-stent assembly is introduced within the patient's vasculature using conventional techniques through a guiding catheter which is not shown. A guidewire 18 is disposed across the damaged arterial
10 section and then the catheter-stent assembly is advanced over a guidewire 18 within the artery 15 until the stent 10 is directly under detached lining 16 of the damaged arterial section. The balloon 14 of the catheter is expanded, expanding the stent 10 against the artery 15, which is illustrated in FIG. 2. While not shown in the drawing, the artery 15 is preferably expanded slightly by the
15 expansion of the stent 10 to seat or otherwise fix the stent 10 to prevent movement. In some circumstances during the treatment of a stenotic portion of an artery, the artery may have to be expanded considerably in order to facilitate passage of blood or other fluid therethrough. This expansion is easily observable by the interventionalist with the radiopaque stent of the present invention. While
20 balloon expandable stents are described, it is contemplated that some stent embodiments of the present invention are self expanding.

 The stent 10 serves to hold open the artery 15 after the catheter 11 is withdrawn, as illustrated in FIG. 3. Due to the formation of the stent 10 from the elongated tubular member, the undulating component of the cylindrical
25 elements of the stent 10 is relatively flat in transverse cross section so that when the stent is expanded, the cylindrical elements are pressed into the wall of the artery 15 and as a result do not interfere with the blood flow through the artery 15. The cylindrical elements 12 of the stent 10 which are pressed into the wall of the artery 15 are eventually covered with endothelial cell growth which
30 further minimizes blood flow interference. The undulating pattern of the cylindrical sections 12 provides good characteristics to prevent stent movement

within the artery. Furthermore, the closely spaced cylindrical elements at regular intervals provide uniform support for the wall of the artery 15, and consequently are well adapted to tack up and hold in place small flaps or dissections in the wall of the artery 15 as illustrated in FIGs. 2 and 3. The undulating pattern of the radiopaque stent is readily discernable to the interventionalist performing the procedure.

FIG. 4 is an enlarged perspective view of the stent 10 shown in FIG. 1 with one end of the stent shown in an exploded view to illustrate in greater detail the placement of interconnected elements 13 between adjacent radially expandable cylindrical elements 12. Each pair of interconnecting elements 13 on one side of the cylindrical element 12 are positioned to achieve maximum flexibility for the stent 10. In an embodiment shown in FIG. 4, the stent 10 has three interconnecting elements 13 between adjacent radially expandable cylindrical elements 12 which are 120 degrees apart. Each pair of interconnecting elements 13 on one side of a cylindrical element 12 are offset radially 60 degrees from the pair on the other side of the cylindrical element. The alternation of the interconnecting elements results in a stent which is longitudinally flexible in essentially all directions. Various configurations for the placement of interconnecting elements are possible. However, as previously mentioned, all of the interconnecting elements of an individual stent are secured to either the peaks or valleys of the undulating structural elements in order to prevent shortening of the stent during the expansion thereof.

The number of undulations may be varied to accommodate placement of interconnecting elements 13, e.g., at the peaks of the undulations or along the sides of the undulations as shown in FIG. 5.

As best observed in FIGs. 4 and 5, cylindrical elements 12 are in the form of a serpentine pattern 30. As previously mentioned, each cylindrical element 12 is connected by interconnecting elements 13. Serpentine pattern 30 is made up of a plurality of U-shaped members 31, W-shaped members 32 and Y-shaped members 33, each having a different radius so that expansion forces are more evenly distributed over the various embodiments.

The illustrative stent 10 and other stent structures can be made using several techniques, including laser machining. One method of making the radiopaque stent is to cut a thin walled tubular member made of the radiopaque cobalt chromium alloy described herein, to remove portions of the tubing in a desired pattern for the stent, leaving relatively untouched the portions of the radiopaque cobalt chromium tubing which are to form the stent. In accordance with one method of making the device of the present invention, the tubing is cut in a desired pattern using a machine-controlled laser as illustrated schematically in FIG. 6.

The tubing is a cobalt chromium tubing with radiopaque elements. One formulation is L-605, also known as a Haynes 25, MSRR 9500/23, AMS 5796, UNS R30605, 52Co 20Cr 10Ni 15W, OMAT 3/64A, Alacrite X.S.H. The elemental composition of L-605 is as follows:

	<u>Element</u>	<u>Weight Percent</u>
15	Co	balance
	Cr	19-21%
	W	14-16%
	Ni	9-11%
	Fe	3% max
20	Mn	1-2%
	Si	0.40% max
	P	0.04% max
	C	0.05-0.15%
	S	0.03% max

25

This alloy has a melting range of 2425 to 2570 degrees Fahrenheit, a maximum hardness of 277 HB and a density of 9.1 gm/cc. This alloy in annealed bar form has a minimum ultimate tensile strength of 125 ksi, a minimum yield strength of 45 ksi and a minimum total elongation of 30%.

30

	<u>Element</u>	<u>Weight Percent</u>
	Co	Balance
5	Cr	10-25%
	W and/or Ta	10-30%
	Ni	5-30%
	Fe	5% max
	Mn	1-5%
10	Mo, Si, P, C, S	1% max

Typically, before crimping, the stent has an outer diameter on the order of about 0.04 to 0.10 inches in the unexpanded condition, approximately the same outer diameter of the tubing from which it is made, and may be
15 expanded to an outer diameter in a range of about 1 to 15 millimeters. Stents for peripheral and other larger vessels may be constructed from larger diameter tubing. The strut thickness in a radial direction is in a range of 0.001 to 0.01
inches.

Referring to FIG. 6, in one fabrication embodiment, the tubing 21
20 is put in a rotatable collet fixture 22, of a machine controlled apparatus 23 for positioning the tubing 21 relative to a laser 24. According to machine-encoded instructions, the tubing 21 is rotated and moved longitudinally relative to the laser 24 which is also machine controlled. The laser selectively removes the
material from the tubing by ablation and a pattern is cut into the tube. The tube
25 is therefore cut into the discrete pattern of the finished stent.

The process for cutting a pattern for the stent into the tubing is automated except for loading and unloading the length of tubing. Referring again to FIG. 6, it may be done, for example, using a CNC opposing collet
fixture 22 for axial rotation of the length of tubing. In conjunction with a CNC
30 X-Y table 25 to move the length of tubing axially relatively to a machine-

controlled laser as described. The entire space between collets is patterned using a laser setup of the foregoing example. The program for control of the apparatus is dependent on the particular configuration used.

The tubes are made of one of the cobalt chromium alloys described herein that includes radiopaque elements. The radiopaque materials lie primarily within the transition metal block in the second and third row of the Periodic Table. The tubes have an outside diameter of 0.04 inches to 0.10 inches and a wall thickness of 0.001 inches to 0.010 inches. In one embodiment, the tubes are fixtured under a laser and are positioned utilizing a CNC to generate a very intricate and precise pattern. Due to the thin wall and the small geometry of the stent pattern, it is necessary to have very precise control of the laser, its power level, the focus spot size and the precise positioning of the laser cutting path.

One reason to have precise control of the laser operating parameters is to minimize heat input into the stent structure, which prevents thermal distortion, uncontrolled burnout of the metal, and metallurgical damage from excessive heat. With such lasers, it is possible to make a smooth, narrow cut in the cobalt chromium tubes in very fine geometries without damaging the narrow struts that make up the stent structure. The system of the present invention utilizing such lasers and their available parameter adjustments, makes it possible to cut using a narrow beam which minimizes the heat input into the material.

The positioning of the cylindrical radiopaque cobalt chromium structure requires use of precision CNC equipment. In addition, for some embodiments, a rotary mechanism has been provided that allows the computer program to be written as if the pattern were being cut from a flat sheet. This allows both circular and linear interpolation to be utilized in programming.

The optical system which expands the original laser beam delivers the beam through a viewing head and focuses the beam onto the surface of the tube, incorporates a coaxial gas jet and nozzle that helps remove debris from the cut face and cools the region where the beam interacts with the material

as the beam cuts and vaporizes the metal
as it cuts the top surface of the tube and prevent the beam, along with the molten
metal and debris from the cut, from impinging on the opposite surface of the
tube.

5 In addition to the laser and the CNC positioning equipment, the
optical delivery system includes a beam expander to increase the laser beam
diameter, a circular polarizer, typically in the form of a quarter wave plate, to
eliminate polarization effects in metal cutting, provisions for a spatial filter, a
binocular viewing head and focusing lens, and a coaxial gas jet that provides for
10 the introduction of a gas stream which surrounds the focus beam and is directed
along the beam axes.

The cutting process utilizes an assist gas with the laser beam,
resulting in a narrow cut area and minimal molten slag along the cut. In order to
remove the slag debris from the cut allowing the scrap to be removed from the
15 remaining stent pattern, it is necessary to soak the cut tube in solutions of
mineral acids. Before it is soaked, the tube is ultrasonically cleaned in a mineral
acid solution after cutting.

Direct laser cutting produces edges which are essentially
perpendicular to the axes of the laser cutting beam in contrast with chemical
20 etching and the like which may produce patterned edges which are angled.
Hence, the laser cutting process essentially provides stent cross sections from
cut- to- cut which are square or rectangular. As depicted, cylindrical elements 12
are comprised of struts 30 which have generally rectangular cross sections 32
wherein the stent is laser cut from a tubular member. The struts have generally
25 perpendicular edges 31 formed by the laser cut. The resulting stent structure
provides superior performance.

In other embodiments, the radiopaque cobalt chromium stent of
the present invention is fabricated of radiopaque cobalt chromium alloy wire
elements. In another embodiment, the stent is made of a radiopaque cobalt
30 chromium flat stock. In another embodiment, the stent is made of radiopaque

cobalt chromium materials using near-net shape processing such as metal injection molding.

When expanded, the stent of the present invention covers about 10-45% of an arterial wall surface area. The radiopaque cobalt chromium stent of the present invention can withstand at least about 30% tensile deformation before failure.

EXAMPLE 1

The alloy used was cobalt chromium L-605 per ASTM specification F90-97. Small diameter tubing was fabricated of fully solution annealed rod stock. After gun-drilling, the resulting tube was cold drawn down in stages. Between draws, the alloy was annealed to maintain ductility. Final dimensions of the tube were about 0.070 inches outer diameter by a 0.004 inch thick wall. The material passed the cytotoxicity and hemolysis test per ISO 10993 indicating a basic level of biocompatibility. A serpentine pattern was cut into the tubing utilizing a laser in a CNC controlled machine as depicted in FIG. 6. After laser cutting, the slag was removed from the stents by a combination of sonication and soaking in a mineral acid solution. Using a 4.0 x 20 mm ACS ROCKET™ balloon dilatation catheter the stents were expanded to 4.0 mm diameter. Inspection by light microscope and scanning electron microscopy confirmed that there were no cracks or broken struts in the stent indicating the alloy had sufficient ductility to accommodate stent expansion. A comparative radiopacity analysis was done using fluoroscopy. The radiopaque cobalt chrome stent (average thickness 76 microns) was compared to :

1. MULTI-LINK® DUET™, 316L stainless steel, average thickness 140 microns;
2. A 316L stent of the same serpentine pattern as the radiopaque cobalt chrome stent with an average strut thickness of 80 microns.

Visual inspection and computer densitometry analysis of the fluoroscopic images showed the radiopaque cobalt chrome to be more

5 One other alloy suitable for use in the present invention is
HAYNES alloy 188, which is a cobalt-nickel-chromium-tungsten alloy. This
alloy has good ductility and is readily fabricated by conventional techniques,
such as cold working, forging or other hot working methods. This alloy also
shows good corrosion resistance to chloride and oxidizing environments. The
10 188 alloy is produced in the form of plate, sheet, strip, billet, bar, wire, pipe and
tubing.

In rod form, the 188 alloy has an ultimate tensile strength of about
137 ksi, a 0.2% yield strength of 67 ksi and an ultimate elongation in 2 inches of
53%. The 188 alloy has a comparative impact strength after 8000-hour
15 exposures of 143 ft.-lbs, solution-annealed Charpy V-Notch Impact test.

While particular forms of the invention have been illustrated and
described, various modifications can be made without departing from the spirit
and scope of the invention.

WHAT IS CLAIMED IS:

1. A radiopaque stent comprising a cylindrical main body comprising a cobalt
chromium alloy that comprises cobalt, chromium, and one or more radiopaque materials.
2. The radiopaque stent of claim 1, wherein the cobalt chromium alloy is balloon expandable.
3. The radiopaque stent of claim 2 wherein the main body has a first unexpanded outside diameter of about 0.04 to about 0.10 inches and a second expanded diameter of at least about 1 to 15 millimeters.
4. The radiopaque stent of claim 1 wherein the main body has a wall thickness of at least about 0.001 inches.
5. The radiopaque stent of claim 1 further comprising nickel.
6. The radiopaque stent of claim 1 wherein the radiopaque materials are selected from the group comprising Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Te, I, Ba, La, Hf, Ta, W, Re, Os, Ir, Pt, Au and combinations of these materials.
7. The radiopaque stent of claim 1 wherein the tubular main body comprises an undulating pattern.
8. The radiopaque stent of claim 1 wherein the tubular main body is a solid radiopaque tube.

defines a backbone.

13. The radiopaque stent of claim 1 wherein the cylindrical main body is expandable.

15

14. The radiopaque stent of claim 1 wherein the chromium concentration is about 10 to 25 percent by weight.

20

15. The radiopaque stent of claim 1 wherein the concentration of radiopaque materials is about 10 to 30 percent by weight.

16. The radiopaque stent of claim 1 wherein the concentration of nickel is about 5 to 30 percent by weight.

25

17. The radiopaque stent of claim 1 wherein the main body is visible but does not obscure the underlying vessel morphology when subjected to imaging.

18. The radiopaque stent of claim 1 wherein the cylindrical main body comprises one or more wires comprising cobalt, chromium and one or more radiopaque materials, wherein the wires are shaped to form the cylindrical main body.

5

19. An assembly, comprising;
a catheter; and
a radiopaque stent mounted on the catheter, wherein the stent comprises a cobalt chromium alloy that comprises cobalt, chromium and one or more

10 radiopaque materials.

20. The assembly of claim 19 wherein the radiopaque materials are selected from the group comprising Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Te, I, Ba, La, Hf, Ta, W, Re, Os, Ir, Pt, Au and combinations of these materials.

15

21. The assembly of claim 19 and further comprising a balloon mounted to the catheter, the balloon positioned to expand the radiopaque stent.

22. A method for making a radiopaque stent, comprising:
providing a tube comprising a cobalt chromium alloy that comprises cobalt, chromium and one or more radiopaque materials; and
shaping the tube to form the radiopaque stent.

20

23. The method of claim 22 wherein the tube is shaped by cutting or etching.

25

24. The method of claim 22 wherein the tube is cut by a laser.

25. The method of claim 22 and further comprising cleaning the radiopaque stent.

30

26. The method of claim 22 and further comprising providing a flat stock comprising the cobalt chromium alloy that comprises cobalt, chromium and one or more radiopaque materials; rolling the flat stock and welding the flat stock to form the tube.

5

27. The method of claim 22 wherein the tube is shaped by near net shape manufacturing.

28. The method of claim 27 wherein the near net shape manufacturing
10 comprises metal injection molding.

29. A method for positioning a stent in a lumen of a living being, comprising:

providing a radiopaque stent comprising a cylindrical main body
15 comprising a cobalt chromium alloy that comprises cobalt, chromium, and one or more radiopaque materials wherein the stent is unexpanded;

transporting the radiopaque stent to a lesion site in the lumen wherein the stent is optionally imaged during transport; and
20 expanding the radiopaque stent to contact the lesion wherein the stent is imaged during or after expanding the radiopaque stent.

30. A radiopaque stent comprising one or more wires, the wires comprising a cobalt chromium alloy that comprises cobalt, chromium and one or more
25 radiopaque materials.

31. The radiopaque stent of claim 30 wherein the wire or wires are balloon expandable.

30 32. The radiopaque stent of claim 30 wherein the wire or wires are self-expanding.

33. The radiopaque stent of claim 30 wherein the radiopaque materials are selected from the group comprising Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Te, I, Ba, La, Hf, Ta, W, Re, Os, Ir, Pt, Au and combinations of these materials.

5

34. A radiopaque stent comprising a tube, the tube comprising a cobalt chromium alloy that comprises cobalt, chromium and one or more radiopaque materials.

10 35. The radiopaque stent of claim 34 wherein the tube is balloon expandable.

36. The radiopaque stent of claim 34 wherein the tube is self-expanding.

15 37. The radiopaque stent of claim 34 wherein the radiopaque materials are selected from the group comprising Zr, Nb, Mo, Tc, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Te, I, Ba, La, Hf, Ta, W, Re, Os, Ir, Pt, Au and combinations of these materials.

A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 A61L31/18 A61L31/02 A61F2/06

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 A61L A61F A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	WO 97 33534 A (BEYAR MORDECHAY ; BEYAR RAFAEL (IL); DOR OFER (IL); GLOBERMAN OREN) 18 September 1997 (1997-09-18) page 2, line 28 - line 29; claims ---	1
P, X	WO 00 54704 A (ADVANCED CARDIOVASCULAR SYSTEM) 21 September 2000 (2000-09-21) page 3, line 26 - line 29; claims ---	1-37

☒ Further documents are listed in the continuation of box C.☒ Patent family members are listed in annex.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

T later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *Z* document member of the same patent family

Date of the actual completion of the international search

26 July 2001

Date of mailing of the international search report

06/08/2001
